👉 채팅을 통해 다양한 메시지 전송

2. 아티팩트 적립과정

The screenshot shows the README for the JADX project on GitHub. At the top, there's a header with the JADX logo and the name 'JADX'. Below this, a row of status badges is displayed: 'Build passing', 'contributors 88', 'downloads 1.5M', 'downloads@latest 18k', 'release v1.4.7', 'maven-central v1.4.7', and 'license apache'. The main text describes JADX as a 'Dex to Java decompiler' and provides command line and GUI tools for producing Java source code from Android Dex and Apk files. A warning section with three exclamation marks states that JADX can't decompile all 100% of the code and refers to a 'Troubleshooting guide' for workarounds. Under 'Main features:', a bulleted list includes: decompile Dalvik bytecode to java classes from APK, dex, aar, aab and zip files; decode `AndroidManifest.xml` and other resources from `resources.arsc`; and deobfuscator included. Under 'jadx-gui features:', a bulleted list includes: view decompiled code with highlighted syntax; jump to declaration; and find usage.

jadx - Dex to Java decompiler

Command line and GUI tools for producing Java source code from Android Dex and Apk files

!!! Please note that in most cases **jadx** can't decompile all 100% of the code, so errors will occur. Check [Troubleshooting guide](#) for workarounds

Main features:

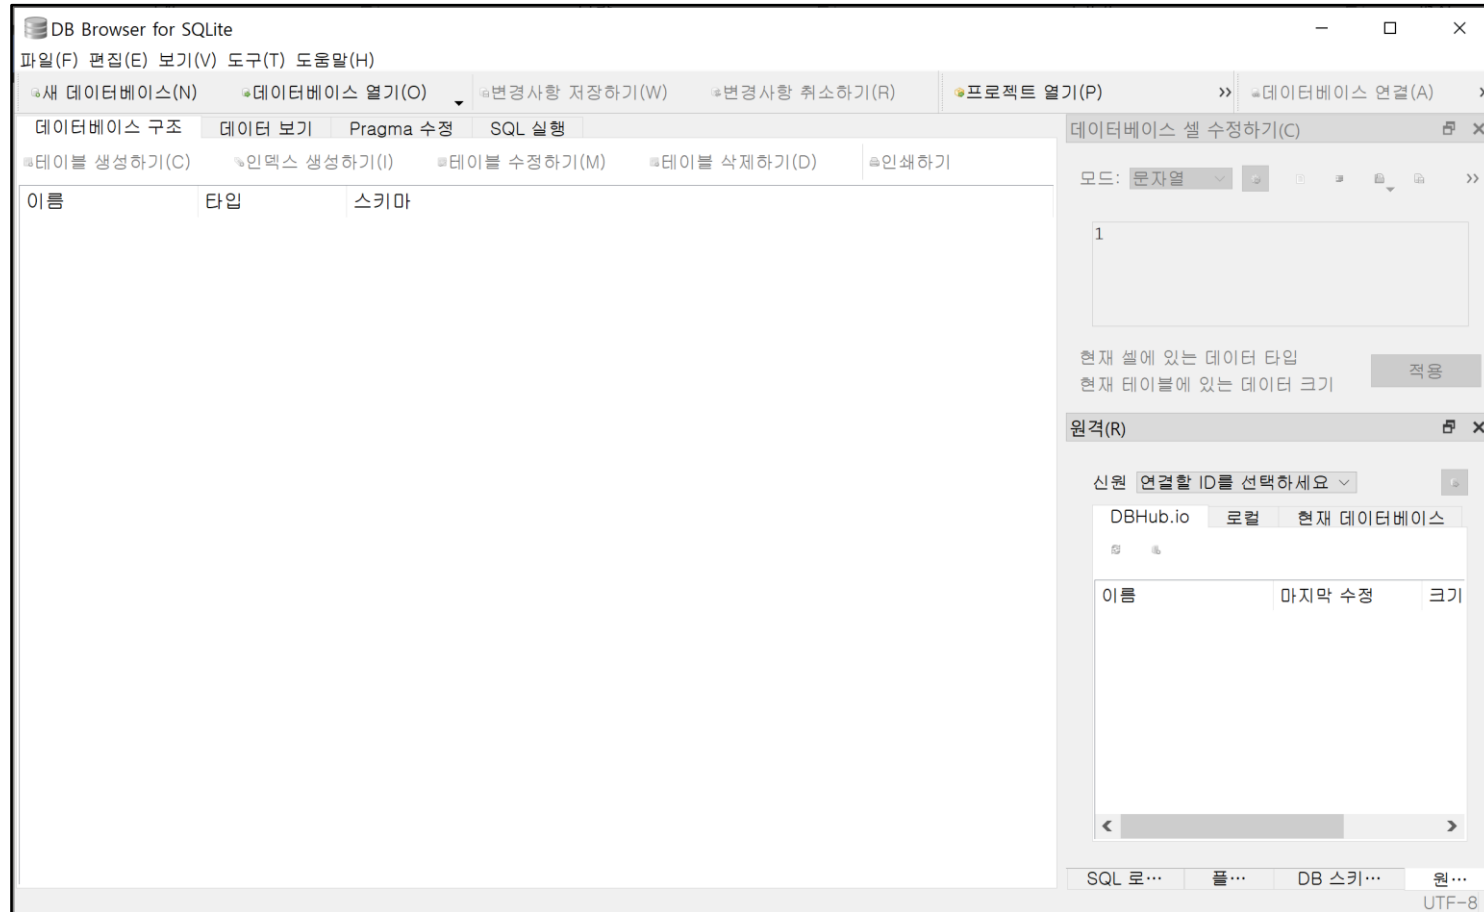

- decompile Dalvik bytecode to java classes from APK, dex, aar, aab and zip files
- decode `AndroidManifest.xml` and other resources from `resources.arsc`
- deobfuscator included

jadx-gui features:

- view decompiled code with highlighted syntax
- jump to declaration
- find usage

👉 jadx를 통해 APK파일 분석

    String string = context.getString(R.string.database_name);
    if (i > 0) {
        string = string + "_v" + i;
    }
    return outline.m3467q(string, ".db");
}

/* renamed from: A */
public void m4915A(List<FeedGroupInfo> list) {
    this.f14891h.beginTransaction();
    try {
        try {
            for (FeedGroupInfo feedGroupInfo : list) {
                this.f14891h.insertWithOnConflict("FeedGroup", null, RestApiEx.m6389h(feedGroupInfo), 5);
            }
            this.f14891h.setTransactionSuccessful();
        } catch (SQLException e) {
            e.printStackTrace();
        }
    } finally {
        this.f14891h.endTransaction();
    }
}
```

👉 EstDatabase 클래스에서 TeamUP_v5.db 생성

4. 데이터 베이스 복호화

```
public EstDatabase(Context context) {
    super(context, m4894i(context, 5), null, 20);
    SQLiteDatabase writableDatabase;
    this.f14891h = null;
    for (int i = 0; i < 5; i++) {
        File databasePath = context.getDatabasePath(m4894i(context, i));
        if (databasePath.exists()) {
            databasePath.delete();
        }
    }
    SQLiteDatabase.loadLibs(context);
    this.f14890g = context;
    try {
        String m4895h = m4895h();
        synchronized (this) {
            writableDatabase = (this.f14891h != null && this.f14891h.isOpen()) ? this.f14891h : writableDatabase;
            writableDatabase = super.getWritableDatabase(m4895h);
            writableDatabase.execSQL("PRAGMA cipher_memory_security = OFF;");
        }
        this.f14891h = writableDatabase;
    } catch (Exception e) {
        e.printStackTrace();
    }
    f14888j = this;
}
```

👉 m4895h()의 리턴 값을 키로 사용함

4. 데이터 베이스 복호화

```
/* renamed from: h */
public final String m4895h() {
    try {
        String m2545I = ScheduleRepeatEditAndroidViewModel_AssistedFactory_Factory.m2545I(Settings.Secure.getString(this.f14890g.getContentResolver(), "android_id"));
        return AESCrypt.m2132b(m2545I, m2545I);
    } catch (Exception e) {
        e.printStackTrace();
        return ScheduleRepeatEditAndroidViewModel_AssistedFactory_Factory.m2545I(Settings.Secure.getString(this.f14890g.getContentResolver(), "android_id")) + Settings.S
    }
}
```

👉 m4895h()

👉 android_id를 m2545I로 저장한 후,
m2132b()에 넣은 값을 받음

👉 android_id: 기기의 고유한 식별자

👉 기기마다 다른 값이 나옴
→ 디바이스를 구별하는 용도로 사용

👎 아직 찾지 못함...

4. 데이터 베이스 복호화

```
/* renamed from: h */
